

APIs and Version Control

Go is a statically typed programming language created by Google, and it's made for building high-performance and scalable

```
HelloWorld.go [language = go] package main
```

```
// If we want to also assign some values, we have to do the following: assignedArray := [10]int1, 2, 3, 4, 5, 6, 7, 8, 9, 10
```

For instance, with `var a_slice = make(int[], 0, 7)` we are creating a slice of capacity 7 and with a length of 0. No

```
func main() var aMap = map[string]int {"Mark": 27, "Bob": 21, "Silvia": 19, "Mike": 26
```
